Campus Services Helpdesk

Week 2 — Ideate with AI | Milestone 1 Draft

TRACK · Campus Services Helpdesk PRINCIPLE · Transparency

Idea for instructor approval

Proposed idea. A bilingual Arabic-English chatbot for student questions about registration, deadlines, and university rules. It will answer using a selected set of public university documents, show supporting sources when available, and state clearly when evidence is weak, conflicting, missing, or outside scope instead of guessing.

Transparency focus. Students can see what information the chatbot uses, where an answer comes from, and what it cannot confirm.

Knowledge source. The team will select and check a public university document collection before implementation. No specific policy or document is assumed in this draft.

Two AI-generated concept drafts

Concept Draft 1 · OpenCode

Evidence-first helpdesk

Makes retrieval and evidence visible throughout the conversation.

1. Disclose scope and limits.
2. Search only the indexed public documents and show the search scope.
3. Answer from retrieved passages with citations and a plain-language evidence state.
4. Show weak, missing, or conflicting evidence without guessing.
5. Decline out-of-scope questions; offer a human route only if configured.
6. Allow source inspection and optional problem feedback.

The supplied 12-step draft also proposes language controls, feedback logging, session summary, and a prototype outline.

Concept Draft 2 · Claude

“Show Your Source”

Builds the student journey around checking every answer against a visible source.

1. Introduce the bot’s limits and document scope.
2. Ask in Arabic or English and show the search state.
3. Answer with an evidence card: source, section, date, link, and quote.
4. Let the student open the original passage.
5. Explain weak evidence and out-of-scope refusals.
6. Offer correction or official contact when available.

The supplied 9-step storyboard also proposes source reporting, bilingual source comparison, and saving cited answers.

Concept labels follow the materials supplied by the team: OpenCode is the attached 12-step scope note; Claude is the pasted “Show Your Source” storyboard.

Side-by-side strengths and weaknesses

Criterion	Concept 1 · Evidence-first (OpenCode)	Concept 2 · “Show Your Source” (Claude)
Strengths	Detailed weak/no-evidence and conflict paths; visible search scope; explicit no-guessing behavior.	Easy-to-follow student journey; strong evidence panel and source inspection; clear correction/contact options.
Weaknesses	12 steps and extras may exceed first-prototype scope; evidence-strength labels need a defensible rule.	Contacts, dates, and authoritative language versions require verified university information.
Feasibility	Feasible when reduced to retrieval, citations, and fallback; defer feedback logs and session export.	Feasible when source cards show only available metadata; defer side-by-side translation unless both versions exist.
Selection	Combine the shared core: source-grounded answers, visible citations, explicit uncertainty, and a clear out-of-scope response. Keep optional features out of the minimum prototype.	

Selected core interaction flow

Step	User / system interaction
1. Ask	Student chooses Arabic or English and asks about registration, a deadline, or a rule.
2. Retrieve	System searches only the team’s selected public university documents.
3. Answer with evidence	Show a concise answer with its supporting passage and source details, when available.
4. Weak or conflicting evidence	State what is missing or conflicting; do not fill gaps with general knowledge.
5. Out of scope	Explain why the system cannot answer; do not infer personal records or decisions.
6. Verify / refer	Let the student open the source. Show an official contact route only after verification.

For instructor feedback: Confirm the document collection and whether an official-contact card belongs in the prototype.

Reference: HAI Term Project 2026 file, §2 (pp. 3–4), §3.1 and §3.3 (pp. 4–5), Week 2 “Ideate with AI” (p. 7), Appendix A (p. 13).

AI Prompt Log · Entry 1

The prompts below reproduce the two prompt texts previously supplied for this project. “What it gave” summarizes the team-provided outputs; keep the complete drafts with the project files.

Tool: OpenCode · Exact prompt

You are a human-AI interaction designer. Draft a core interaction flow for a bilingual Arabic-English Campus Services Helpdesk chatbot for university students. The chatbot answers questions about registration, deadlines, and university rules using only retrieved passages from public university documents. The HAI principle is Transparency. For each step, show what the user does, what the system does, what evidence or source is shown, and what happens when evidence is weak or the question is out of scope. Keep the flow feasible for a student team to prototype. Do not invent university policies, source documents, or tool outputs. Format as numbered steps.

What it gave	A 12-step evidence-first flow covering scope disclosure, bilingual controls, visible retrieval, cited answers, conflict/weak/no-evidence paths, out-of-scope handling, possible human escalation, source inspection, feedback, and session summary. It also outlines a prototype and minimum viable subset.
Team changes and why	Keep scope disclosure, retrieval, citations, weak/conflicting evidence, out-of-scope handling, and source inspection. Defer feedback logs, session exports, advanced highlighting, and complex confidence rules until feasibility and source data are verified.

Revision direction: Use a small source collection and a simple, explainable fallback path for the first prototype.

Prompt Log fields follow Appendix A: tool, exact prompt, what it gave, and what the team changed and why.

AI Prompt Log · Entry 2

Tool: Claude · Exact prompt

Propose a second, distinct concept for the same project: a bilingual Arabic-English Campus Services Helpdesk for student questions about registration, deadlines, and university rules, grounded only in public university documents and aligned with Transparency. Focus on making the system's limits and uncertainty clear. Describe the user journey from asking a question to verifying the answer, including source display, weak-evidence handling, out-of-scope handling, and a way to reach the relevant campus office. Do not invent real university facts. Format as a compact storyboard with user and chatbot actions.

What it gave	A nine-step "Show Your Source" storyboard: scope card, bilingual question, visible search, answer with evidence card, source verification, problem reporting, weak-evidence/out-of-scope responses, official-office route, and a closing reminder.
Team changes and why	Keep the evidence card and source verification. Show dates, authoritative-language claims, or office contacts only when confirmed in selected documents. Defer correction logs and saved-session features from the minimum prototype.

Five-minute check-in

Present the idea for approval, both concepts, the strengths/weaknesses comparison, and the selected direction. Be ready to explain the two tools, prompts, and team revisions.

Before submission: Check that the prompt texts above match the exact prompts entered in each tool and that the concept outputs are attributed to the correct tools.

Source requirement: Week 2 requires two concept drafts from two different AI tools, a short side-by-side comparison, prompt-log entries, and the idea for approval (HAI Term Project 2026 file, p. 7). Appendix A specifies the prompt-log fields (p. 13).
